bringing the foam-inhibiting covering into detachable contact with parts of the foaming mold by permanent magnets in parts of the foaming mold attracting a ferromagnetic coating extending throughout the entire foam-inhibiting covering, the permanent magnets being placed about a portion of the foaming mold receiving the adhering elements of the adhesive closing part to cooperate with the border of the covering overlapping the surface area of the adhering elements.

19. (Amended) A method for producing a foam body part having at least one adhesive closing part with adhering elements, comprising the steps of
arranging an adhesive closing part in a foaming mold for forming a foamed body part;
protecting adhering elements on the adhesive closing part against penetration of foam by arranging a foam-inhibiting covering on a side of the adhesive closing part opposite the adhering elements, the foam-inhibiting covering having a predetermined border width overlapping and extending beyond a surface area of the adhering elements and having a felt or fleece lamina thereon; and

bringing the foam-inhibiting covering into detachable contact with parts of the foaming mold by permanent magnets in parts of the foaming mold attracting a ferromagnetic coating on the foam-inhibiting covering, the permanent magnets being placed about a portion of the mold receiving the adhering elements of the adhesive closing part to cooperate with the border of the covering overlapping the surface area of the adhering elements.
